Abstract

- Customer segmentation is the practice of dividing a company's customers into groups that
 reflect similarity among customers in each group. The goal of segmenting customers is to
 decide how to relate to customers in each segment in order to maximize the value of each
 customer to the business.
- Customer segmentation has the potential to allow marketers to address each customer in the most effective way.
- The groups should be homogeneous within themselves and should also be heterogeneous to each other. The overall aim of this process is to identify high-value customer base i.e. customers that have the highest growth potential or are the most profitable.

Problem Statement

 The main goal is to identify major customer segments like customers that are most profitable and the ones who churned out to prevent further loss of customer by redefining company policies.

Feature Engineering

Extracting Day, Month, Year and Hour from Invoice Date column.

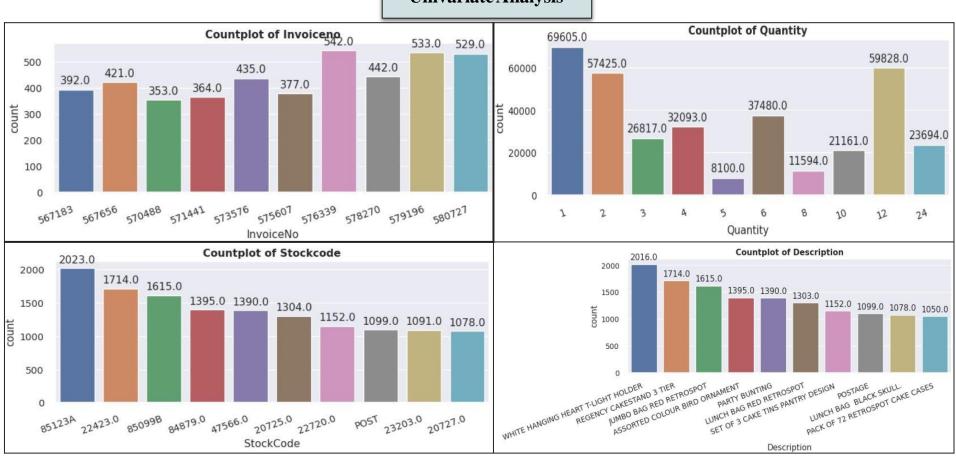

Added Feature 'Total Amount' by multiplying values from the Quantity and Unit Price column.

Added feature 'Time_Type' based on hours to define whether its Morning, Afternoon or Evening.

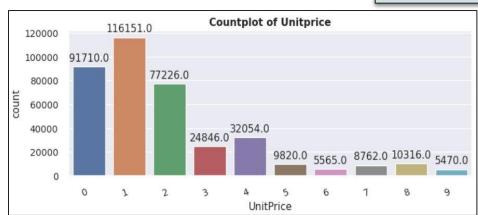

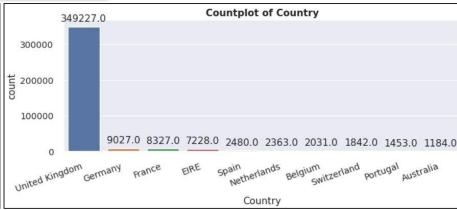

Univariate Analysis

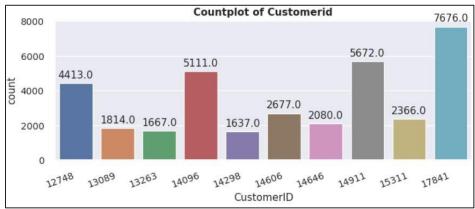

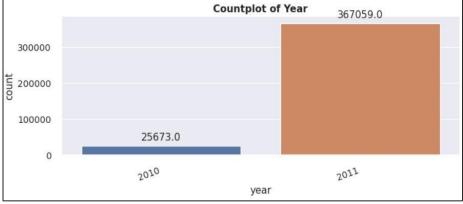

Univariate Analysis

Univariate Analysis

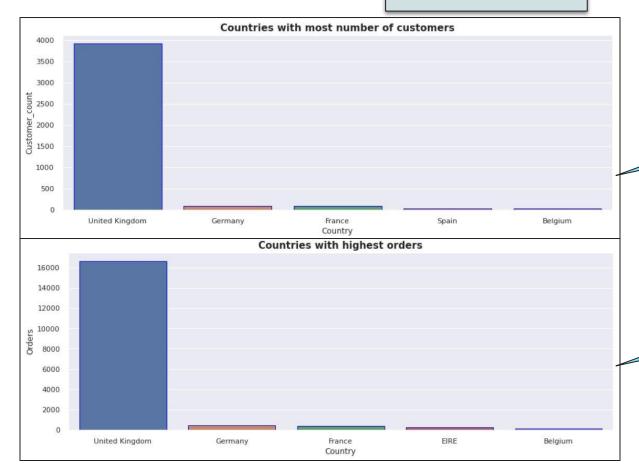

Observations Drawn From The Univariate Analysis:

- □ 'WHITE HANGING HEART T-LIGHT HOLDER' (Stock Code 85123A), 'REGENCY CAKESTAND 3 TIER' (Stock Code 22423) are the top 2 most ordered products.
- Most customers are from 'United Kingdom' also considerable number of customers are also from 'Germany', 'France', 'Eire' and 'Spain'.
- Most of the customer have purchased items in the month of 'October', 'November', 'December' the reason may be most of the festivals are in these months. Less number of customers have purchased the items in the month of 'January', 'February', 'April'.
- ☐ There are no orders placed on 'Saturdays', the reason maybe all retail shop stay closed on this day.
- ☐ Most of the customers have purchased the items in Afternoon, moderate number of customer have purchased the items in Morning and least number of customers in Evening.

Bivariate Analysis

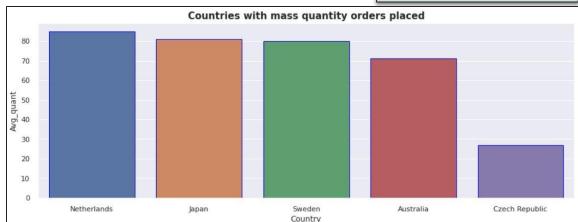

'United Kingdom' has most number of customers than any other countries.

'United kingdom' also topped with most order placed compared to other countries.

Bivariate Analysis

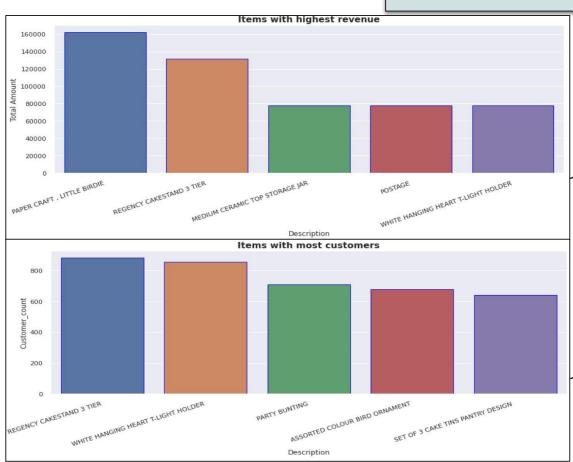

Orders with mass quantity placed by the customer from Netherlands.

'PAPER CRAFT, LITTLE
BIRDIE', 'MEDIUM
CERAMIC TOP STORAGE
JAR' these are the top 2
items with most purchased
in quantity.

Bivariate Analysis

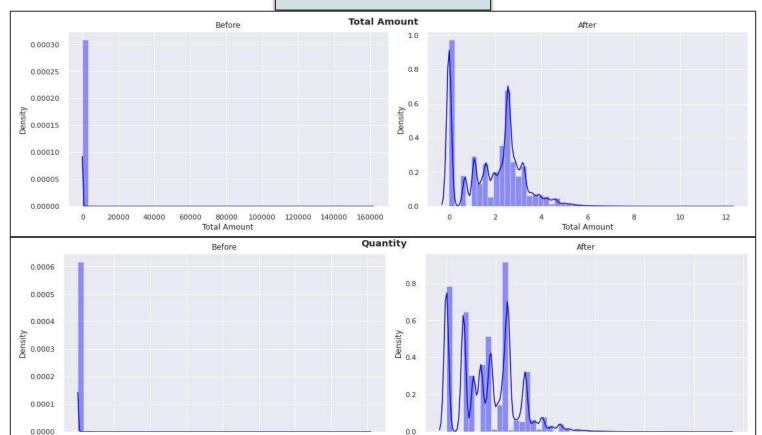

'PAPER CRAFT, LITTLE BIRDIE' product has made highest revenue.

'REGENCY CAKESTAND 3 TIER' is the choice of most of the customer.

Visualizing Distributions

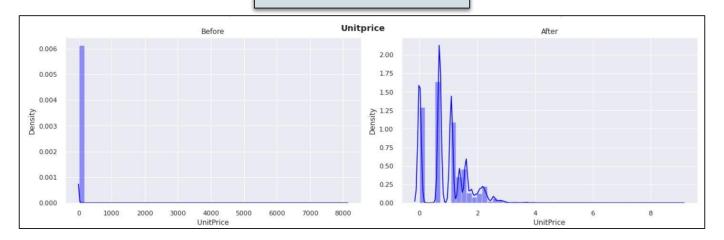

Quantity

Quantity

Visualizing Distributions

☐ After applying log transformation now the distribution plot looks comparatively better than being skewed.

What Is RFM Analysis?

RFM Model which stands for Recency, Frequency and Monetary is one of such steps in which we determine the followings.

- Recency: How recently did the customer visit our website or how recently did the customer purchase.
- ☐ Frequency: How often do they visit or how often do they purchase.
- Monetary: How much revenue we get from their visit or how much do they spend when they purchase.

What It Is Needed?

- □ RFM analysis is a marketing framework that is used to understand and analyze customer behaviour based on the above three factors Recency, Frequency and Monetary.
- ☐ The RFM analysis will help the businesses to segment their customer base into different homogenous groups so that they can engage with each group with different targeted marketing strategies.

RFM Model Analysis

RFM Dataset

	Recency	Frequency	Monetary	R	F	M	RFM_Group	RFM_Score
CustomerID								
12346	325	1	74215	4	4	1	441	9
12347	2	182	3012	1	1	1	111	3
12348	75	31	944	3	3	2	332	8
12349	18	73	1404	2	2	1	221	5
12350	310	17	244	4	4	3	443	11

Conditions For Best Customers

- ☐ Recency Less
- Frequency More
- Monetary More

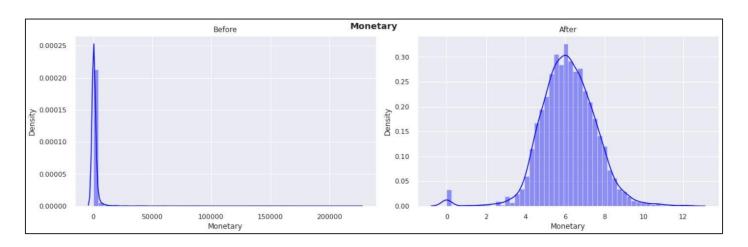

RFM Model Analysis

RFM Model Analysis

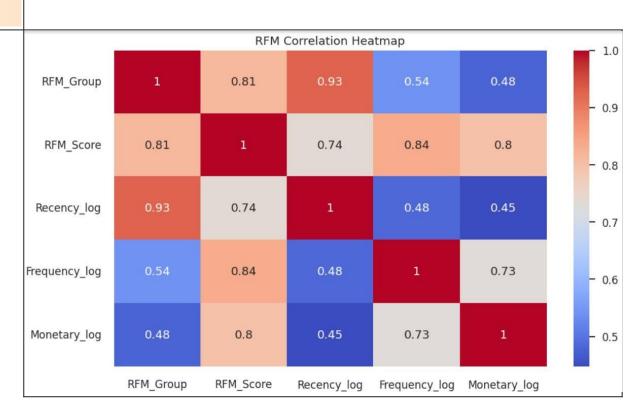

■ Earlier the distributions of Recency, Frequency and Monetary columns were positively skewed but after applying log transformation the distributions appear to be symmetrical and normally distributed.

RFM Model Analysis

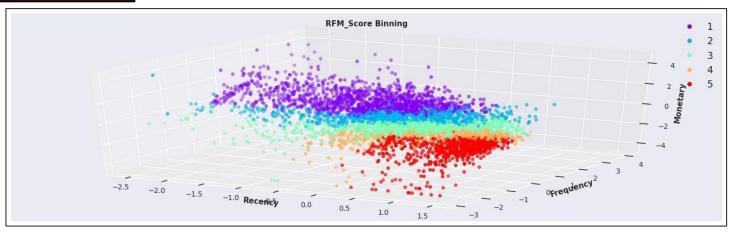

RFM CORRELATION HEATMAP

- ☐ It is clear that 'Recency' is highly correlated with RFM_Group value, whereas Frequency and Monetary is moderately correlated with RFM_Group.
- □ Also RFM_Score is equally correlated with 'Recency', 'Frequency' and 'Monetary'.

K - Means Clustering

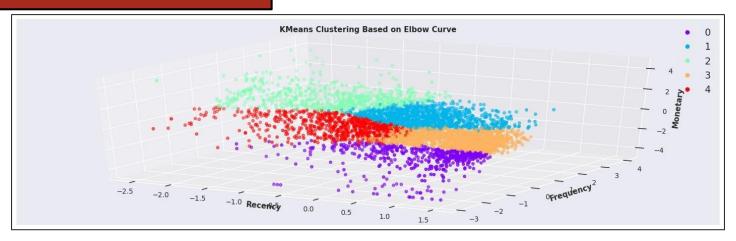

Finding The Optimal 'k': Elbow Curve & Silhouette Score

- ☐ From the above Elbow Curve it seems that number of cluster as 5 is the most suitable.
- ☐ If we go by maximum silhouette score as the criteria for selecting optimal number of clusters then n_clusters can be chosen as 2.

Hierarchical Clustering

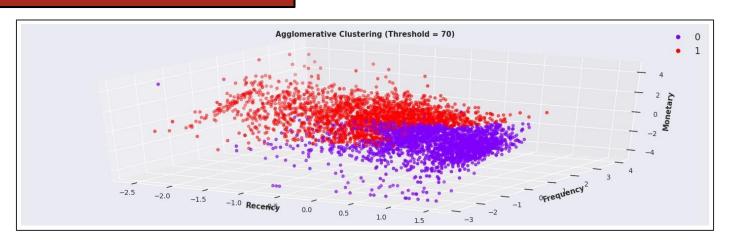

Finding The Optimal 'k': Dendrogram

☐ The number of clusters will be the number of vertical lines which are being intersected by the line drawn using the threshold, larger threshold (y = 70) results in 2 clusters, while the smaller threshold (y = 40) results in 4 clusters.

- However, there can be more modifications on this analysis. One may choose to cluster into more number of depending on company objectives and preferences. The labelled feature after clustering can be fed into classification supervised machine learning algorithms that could predict the classes for new set of observations. The clustering can also be performed on new set of features such as type of products each customer prefer to buy often, segmenting on the basis of time period they visit and much more.
- As machine learning has become more of an ART, there is nothing such as right or wrong. We only try to get the best outcomes that can suit our final objectives. There is, and always will be, a need to improve, going forward.

Challenges Faced

- **☐** Handling Missing values in the dataset.
- □ Creating new features from the existing features for better understanding of the dataset.
- □ Difficulty in deciding 'K' Value before performing K Means Clustering.
